SCOPE AI · PROGRESS UPDATE

What we've built since 23 September

A plain-English guide to the improvements made to the survey assistant and the admin dashboard, and what they mean for the people who use them.

Period covered

23 September – 24 October 2026

AT A GLANCE

The short version

Scope AI is a friendly chat assistant that guides people through a survey, like the one The Raft uses to hear from foster and adoptive families. Behind it sits an admin dashboard where staff see the answers. In the past month we've made the system ready to serve more than one organisation, safer and kinder for participants, and easier for staff to manage. Much of it came straight from user testing.

01

Room for many organisations

Each charity or team gets its own private space. They only ever see their own surveys and answers.

02

Clear roles and permissions

Three levels of access, so everyone can do their job without seeing more than they should.

03

A safety net for worrying answers

Answers that suggest someone may be at risk are flagged, the right people get an email, and staff can record that they've followed up.

04

The assistant gives real contact details

After user testing, the assistant now shares exact email addresses instead of vague advice.

05

Simple team invites

New staff get an email inviting them to set their own password. Nobody has to share passwords.

06

A clearer, kinder survey

On-screen guidance, the current question always in view, a gentler reply when someone is struggling, and an End button.

07

An optional mailing list

People can leave their email at the end to hear from the charity. It's never linked to their answers.

08

A fresh look and a reliable engine

A cleaner dashboard design, and emails that go out automatically within about a minute.

PART 1 LIVE

One system, many organisations

Until September, Scope AI was built around a single organisation. We've now set it up so that **several organisations can share the same system** while their information stays completely separate.

Think of it like a block of flats. Everyone uses the same building, but each household has its own front door and key. One organisation cannot see into another's surveys, answers or staff list.

> **What happened to existing information?** The Raft was set up as the first organisation. All existing surveys and every answer collected so far were moved safely into The Raft's space, so nothing was lost.

Surveys are now managed from the dashboard

Each survey now has its own page in the dashboard. From there staff can:

- see which organisation the survey belongs to;
- switch a survey on or off;
- choose who gets emailed when a worrying answer comes in. There's one list for safeguarding concerns and another for general issues such as accessibility.

PART 2 LIVE

Who can do what

Everyone who logs in now has one of three roles. Each role only sees what it needs.

Role	What they can do
Super Admin The Scope AI team	Sees everything across all organisations. Sets up new organisations and surveys, and manages system-wide settings such as the assistant's instructions and email settings.
Organisation Admin e.g. a Raft manager	Sees their own organisation's surveys and answers. Can invite colleagues, choose their roles and manage the team.
Organisation Member e.g. a Raft staff member	Sees their own organisation's surveys and answers and can follow up on flagged answers. Can't manage other users.

PART 3 LIVE

A safety net for worrying answers

Some survey questions touch on difficult experiences. Occasionally a participant may write something suggesting that they, or a child, could be at risk, or that they're struggling to cope. We've made sure those answers never slip through the cracks.

1. **Someone answers**
   A participant replies to a survey question.
2. **It's checked**
   The system looks for signs of risk, distress or a complaint.
3. **It's flagged**
   Worrying answers are marked and given a level of urgency.
4. **People are told**
   The right staff receive an email straight away.
5. **Staff follow up**
   A staff member reviews it, adds notes and marks it done.

The "Flagged answers" page

Staff now have a dedicated page listing every flagged answer for their organisation. For each one they can see:

- which survey and conversation it came from;
- what kind of concern it is and how urgent;
- why it was flagged.
- what action has already been taken (for example, who was emailed);
- whether someone has reviewed it yet;
- any notes the reviewer left.

The list can be filtered, for example to show only answers *not yet reviewed*, or only the most urgent ones. Once a staff member has followed up, they press **"Mark as reviewed"** and can write a short note about what they did. This gives a simple record that every concern was looked at.

> **Who gets the email?** Each survey has its own list of people to alert, and team members can opt in to receive alerts too. Serious safeguarding concerns go to the safeguarding list, and issues like accessibility complaints go to the general list.

PART 4 LIVE

Acting on user testing

A tester recently went through the survey and took notes. One clear message was that when the assistant suggested getting in touch with The Raft, it was **too vague**. It mentioned a "safeguarding coordinator" or "the official website" without saying how to reach them. We've fixed that.

BEFORE

"You may wish to contact the safeguarding coordinator or visit the official website."

NOW

"If you'd like to talk this through, please email `info@theraftleicester.co.uk`*. For any safety concern, email* `safeguarding@theraftleicester.co.uk`*."*

Illustrative examples. The assistant writes each reply in its own words.

What changed

- **Real email addresses, every time.** Whenever the assistant points someone towards help, it gives the exact email address and is told never to invent other contacts.
- **The right address for the situation.** General questions, feedback and accessibility issues go to the general address. Anything about safety or risk of harm goes to the safeguarding address.
- **Each organisation's own contacts.** The addresses come from each survey's settings, so another organisation using Scope AI would show its own contacts, not The Raft's.
- **The thank-you message at the end** now includes both email addresses instead of "visit our website".
- **"I can't carry on" now reaches the safeguarding team.** Before, answers like "nothing has worked, I can't carry on" were flagged on the dashboard but nobody was emailed. Now they trigger an email to the safeguarding contacts too.

> **One thing to check:** the *first* address in each survey's alert list is the one shown to participants. Make sure it's an address you're happy to share publicly, such as a team inbox rather than someone's personal email.

PART 5 LIVE

A clearer, kinder survey

The same user testing pointed to a few moments where the survey felt confusing or abrupt. On the left is what testers noticed; on the right is what we built.

It wasn't clear how the chat and the answer boxes worked.	**A short "How this works" guide** now appears at the top of the chat. It explains that you chat in the message box at the bottom, answer each question in its own card, and can skip or stop at any time. It can be hidden with "Got it" and brought back with the **?** button.
When someone kept chatting, the question scrolled out of sight.	**The current question now stays in view.** A line under the progress bar shows "Now answering: …" with a **Go to question** button that jumps straight back to the answer box.
After "nothing has worked out", the assistant went straight back to the survey.	**A gentler reply when someone is struggling.** If a message suggests someone is overwhelmed or at risk, the assistant now stops the survey nudges. It responds with care, gives the right email address for support, and reassures them they can take a break, carry on later or end the conversation.
"You're halfway through" appeared out of nowhere.	**A smoother halfway message.** It now explains the progress ("6 of 12 questions answered") and leads into what comes next, for example "Next, a few questions about Training & Development."
There was no clear way to stop.	**An End button** is always in the top bar while the survey is running. It asks for confirmation first. Answers already given are kept, and the goodbye message thanks the person and shares the contact emails.

An optional mailing list

For participants: after the survey, people can leave their email address if they'd like to hear about the charity's events and support. It's entirely optional.

Answers stay anonymous. The email is stored on its own, against the organisation only. It is never connected to the conversation or the answers.

For staff: a new **Mailing List** page in the dashboard shows everyone who signed up, with an **Export to Excel** button. Each organisation only sees its own list.

Organisation admins can remove someone, for example if they ask to unsubscribe.

PART 6 LIVE

Everyday things made easier

Smaller improvements that make the dashboard quicker to set up, easier to support and more dependable.

Inviting new team members

When an admin adds a colleague, the colleague receives an **email invitation with a link to set their own password**. Nobody else types in or passes around passwords. Each person can also choose whether to receive email alerts about flagged answers.

"See what they see"

Super Admins can temporarily **view the dashboard as another user**. If someone says "I can't find a survey", we can see exactly what they see and fix it quickly, without asking for their password.

A cleaner dashboard

The admin dashboard has a new, more polished design. It's calmer to look at and easier to read during long review sessions.

Emails that just go

Alert emails, team invitations and data exports are handled by a background helper that now **runs automatically every minute**. Nobody has to start it, and if it ever hiccups it recovers on its own within minutes.

Checked before it ships. Every feature in this update comes with automatic checks: small test scripts that confirm, for example, that one organisation can never see another's answers, or that a safeguarding concern always emails the right people. These checks run before any change goes live, which helps stop mistakes from reaching real users.

LOOKING AHEAD

What could come next

Every suggestion from the user-testing notes has now been built. While doing that work we spotted a few further improvements worth considering. None of these are built yet.

1. **Alert staff about worries raised in the chat box**
   Today, staff get an email when a worrying answer is typed into a question's answer box. If someone mentions a risk in the general chat instead, the assistant replies with care and contact details, but staff aren't alerted. This should be closed.

2. **Save answers typed into the chat box**
   If someone answers a question in the chat instead of the answer box, the assistant guides them back to the answer box, but what they typed isn't saved as their answer.

3. **A second round of user testing**
   Ask a few parents and carers to try the updated survey, to confirm the new guidance, End button and halfway message feel right in practice.

A few words explained

Organisation
A charity or team using Scope AI, such as The Raft.

Flagged answer
A survey answer the system has marked for a person to look at, because it may show risk, distress or a complaint.

Dashboard
The private website where staff log in to see surveys, answers and flags.

Safeguarding
Protecting children and adults from harm. Safeguarding concerns are always treated as the most urgent.

This summary covers work from 23 September to 24 October 2026. Everything described in Parts 1 to 6 has been built and checked, and is included in the latest update.
